

# Kubernetes

A Deep Dive

# Contact Info

[www.mikenewswanger.com](http://www.mikenewswanger.com)

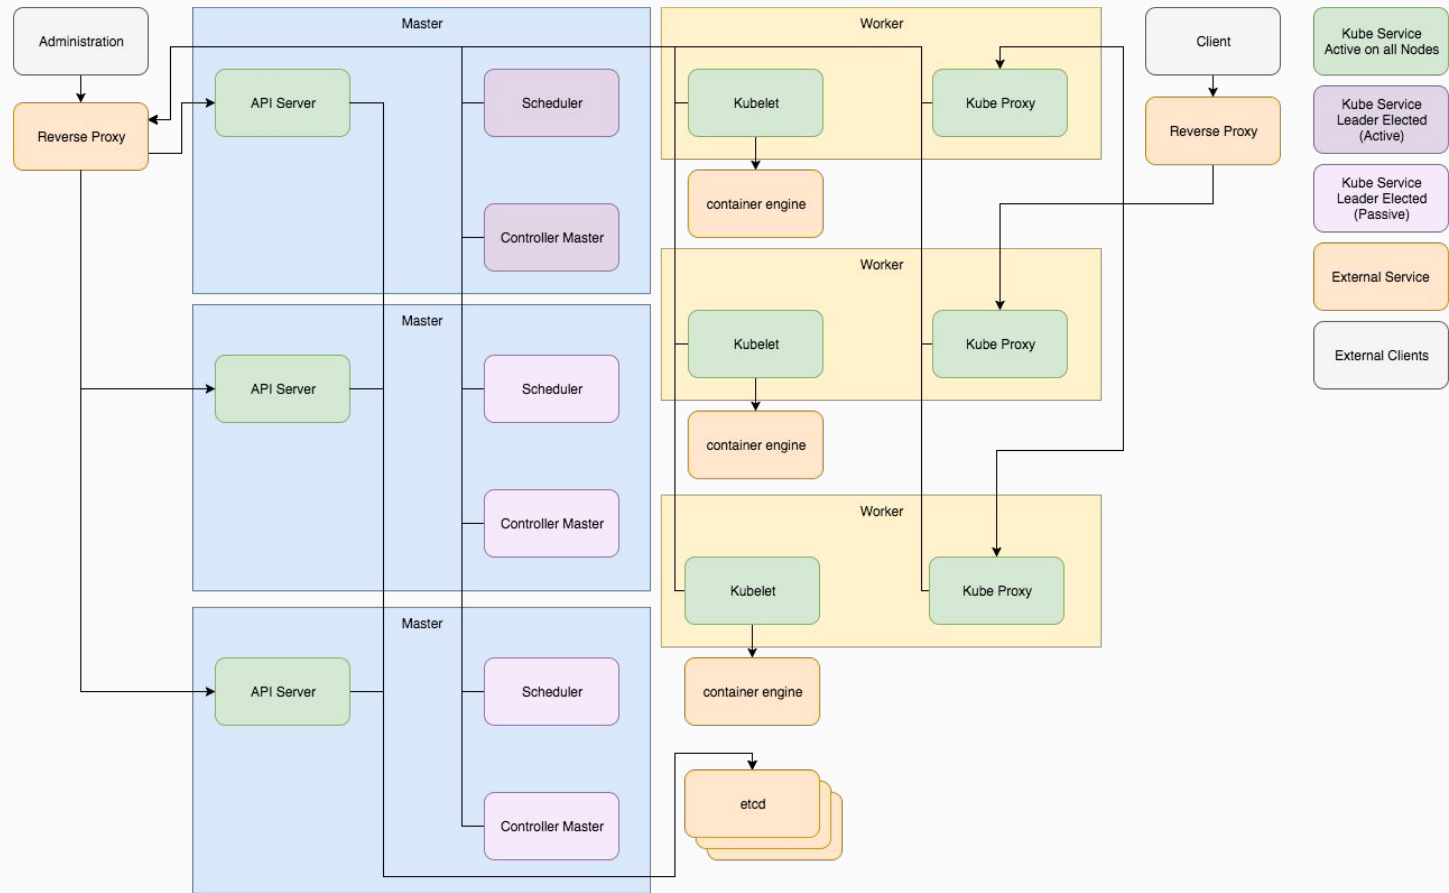

# Terminology

# Terminology

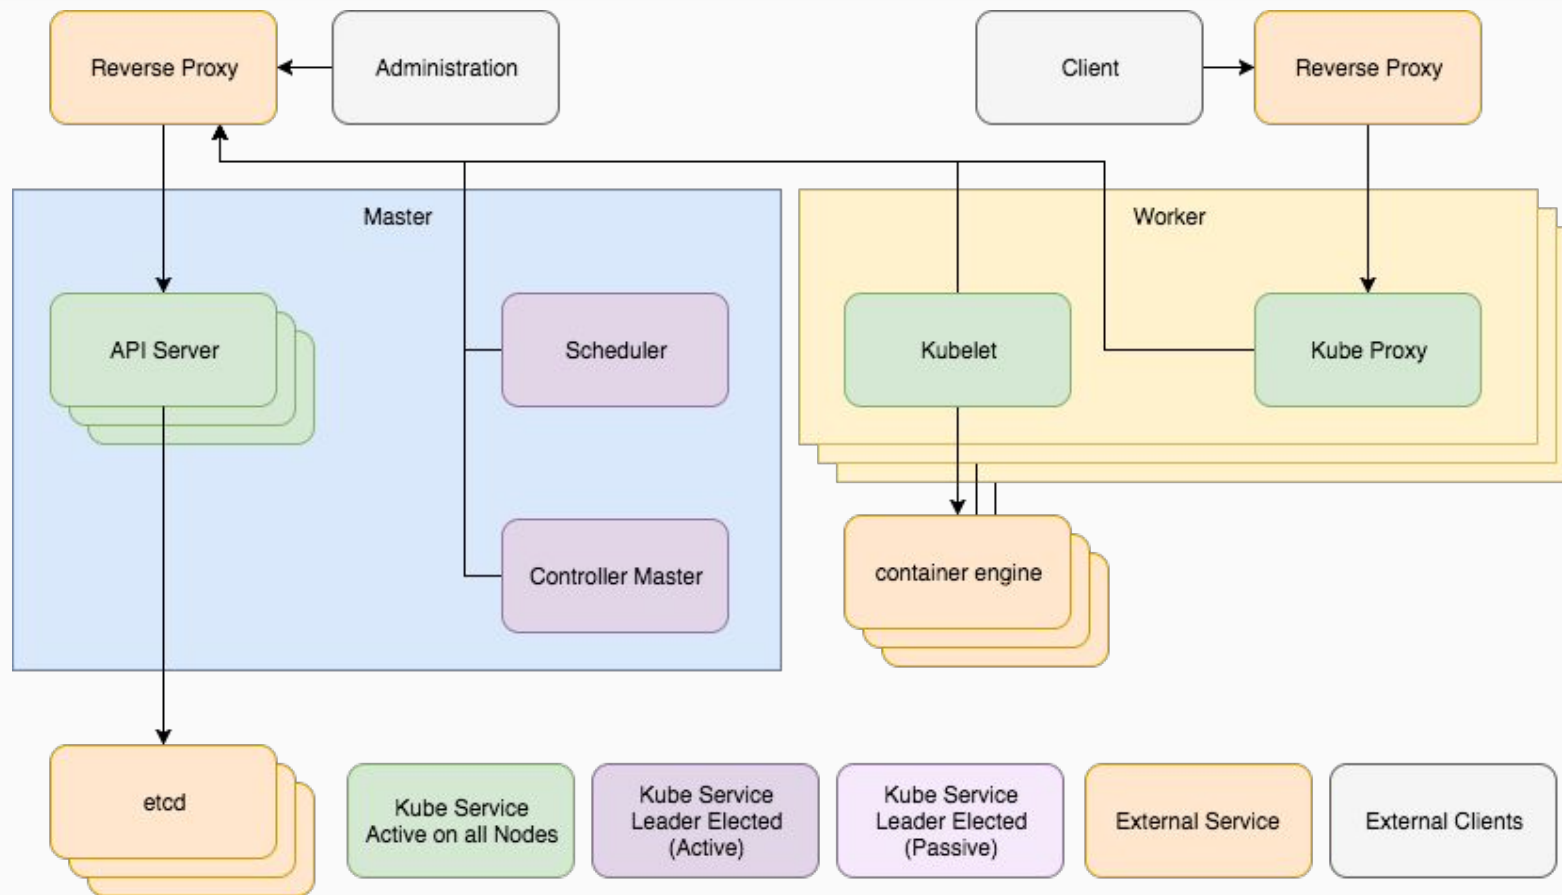

- Pod
  - Set of one or more containers
- Deployment
  - Desired state object for creation of pods
- Service
  - Logical abstraction for sets of pods
- Labels
  - Key - values properties - indexed
- Annotations
  - Key - value properties - not indexed

# Components

# Components

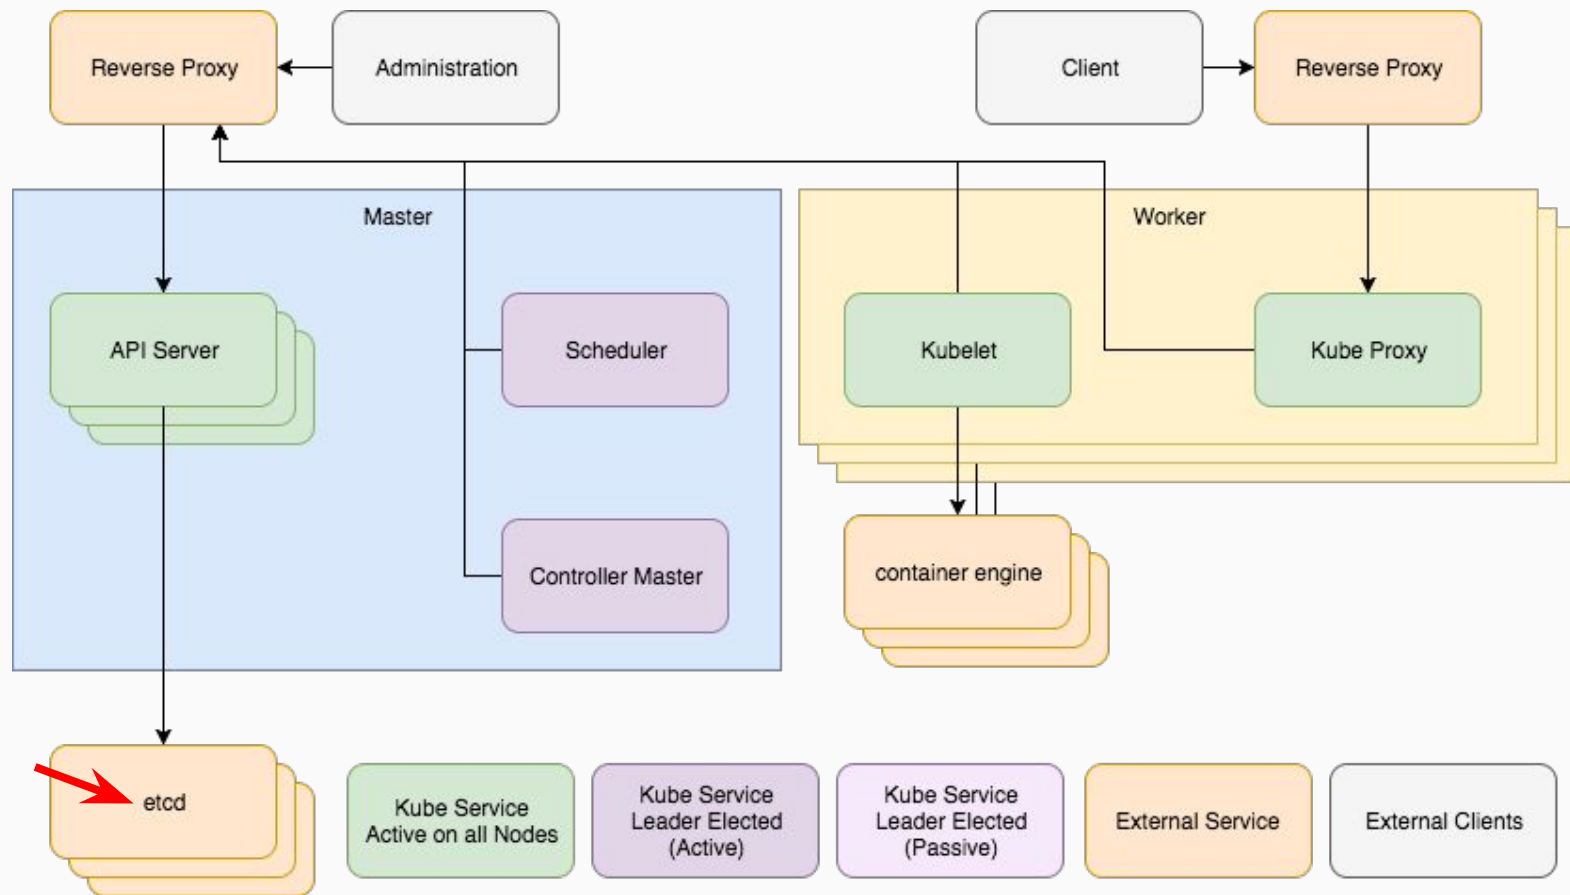

# Components

# Master Nodes

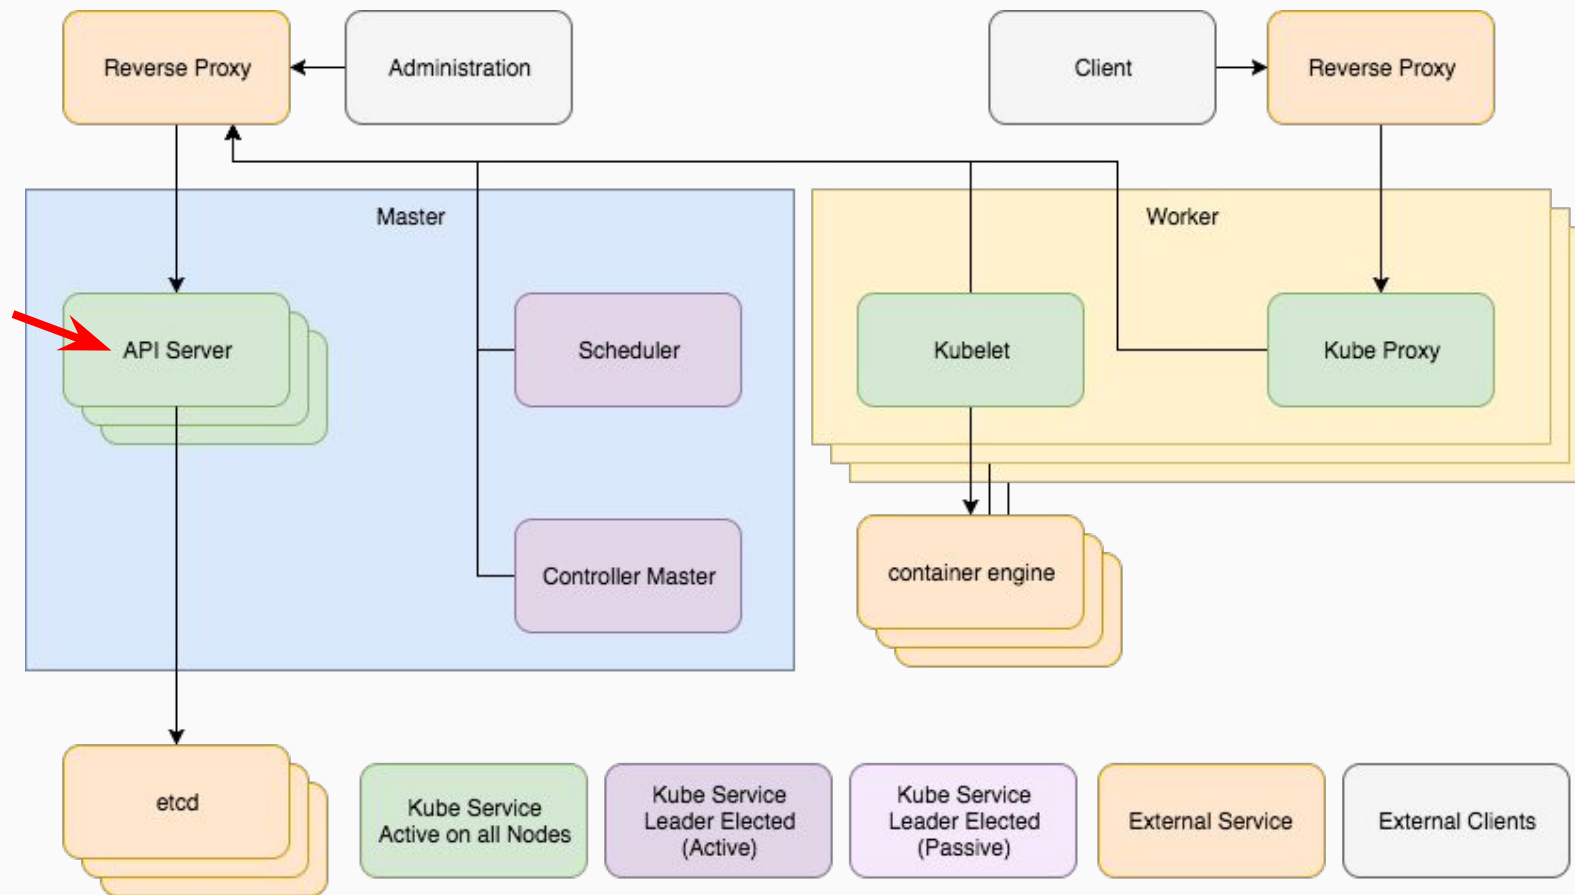

# Datastore

- Persists state and objects
- Distributed key / value store
  - High-Availability Achieved via horizontal scaling
    - Leader elected for master operations
  - Communicates via common protocols
- Uses raft consensus algorithm for master election
- Why use etcd?
  - Replicates quickly
  - Solid Go client libraries
  - Watch functionality
- [github.com/coreos/etcd](https://github.com/coreos/etcd)

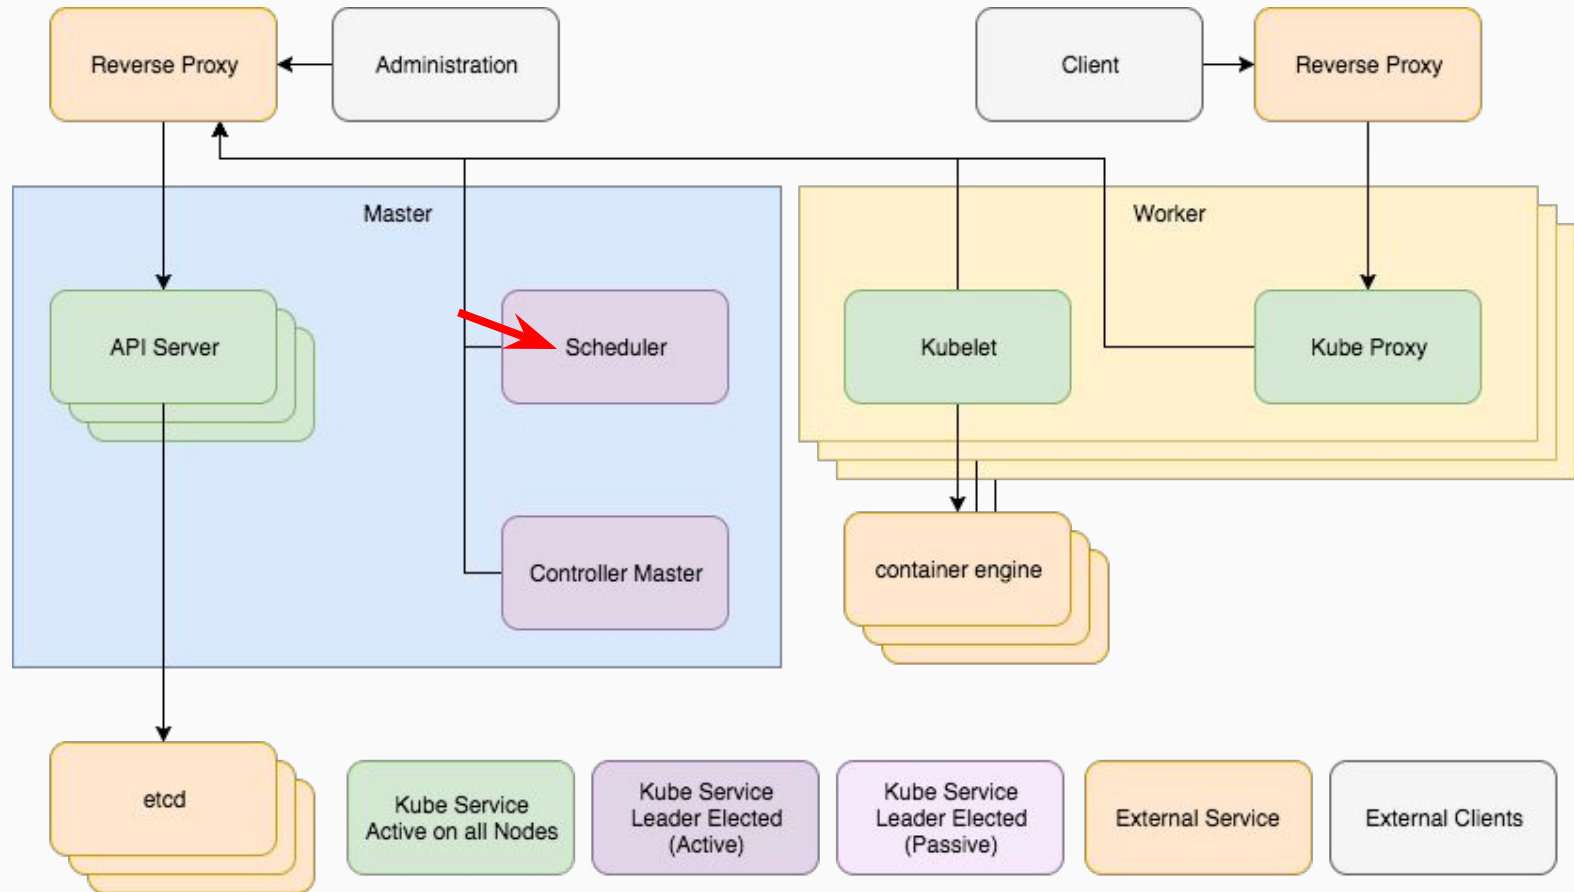

# APIServer

## Component Interaction

- Actions processed via HTTP requests
  - Used by kubectl and internal components
- Interacts with etcd
- Multiple instances can be active simultaneously
  - Reverse-Proxy / VIP for high availability

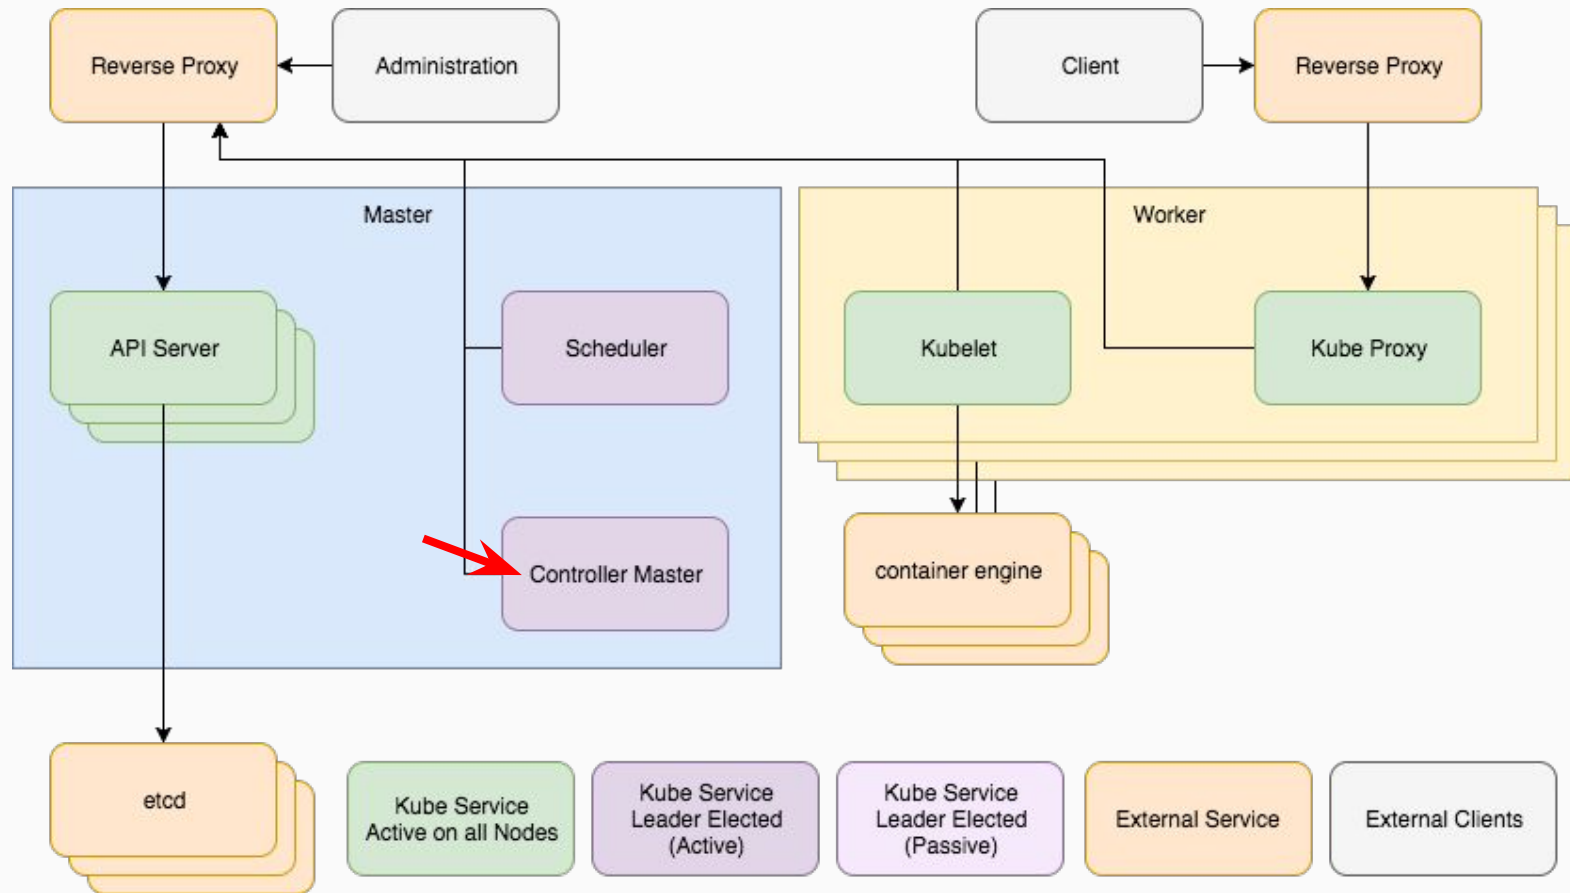

# Scheduler

## Work Coordination

- Sets resource allocation
  - Worker allocation
  - Processes affinity rules
  - Customizable / Replacable
- Master elected

# Controller Master

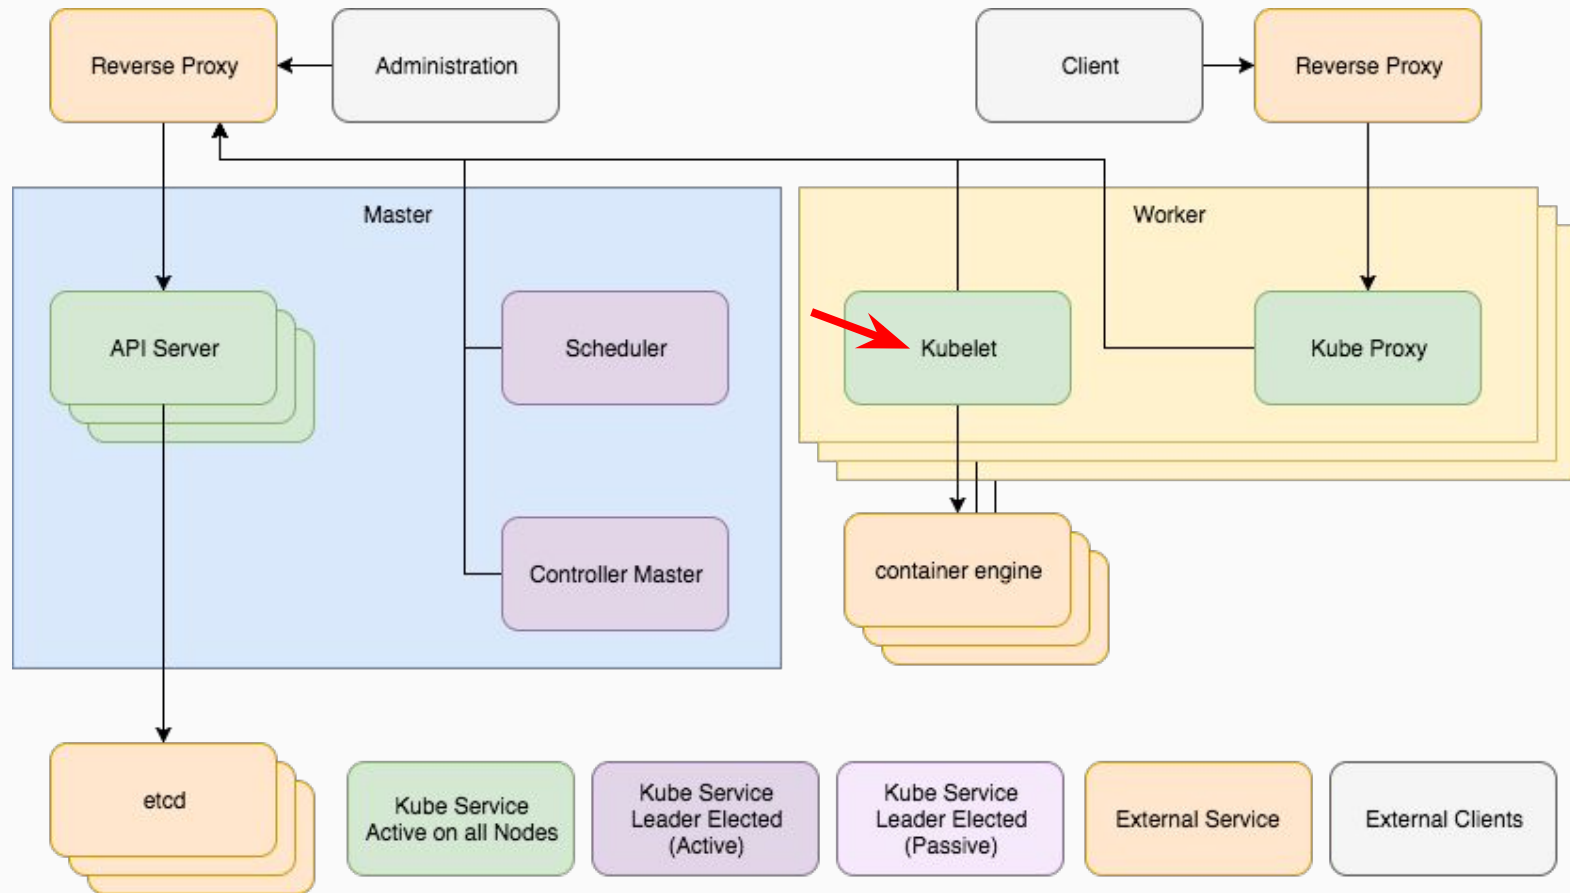

## Internal Decision Making

- Aggregate of multiple controllers
  - Replication
  - Endpoints
  - Services
  - Namespaces
- Master elected

# Worker Nodes

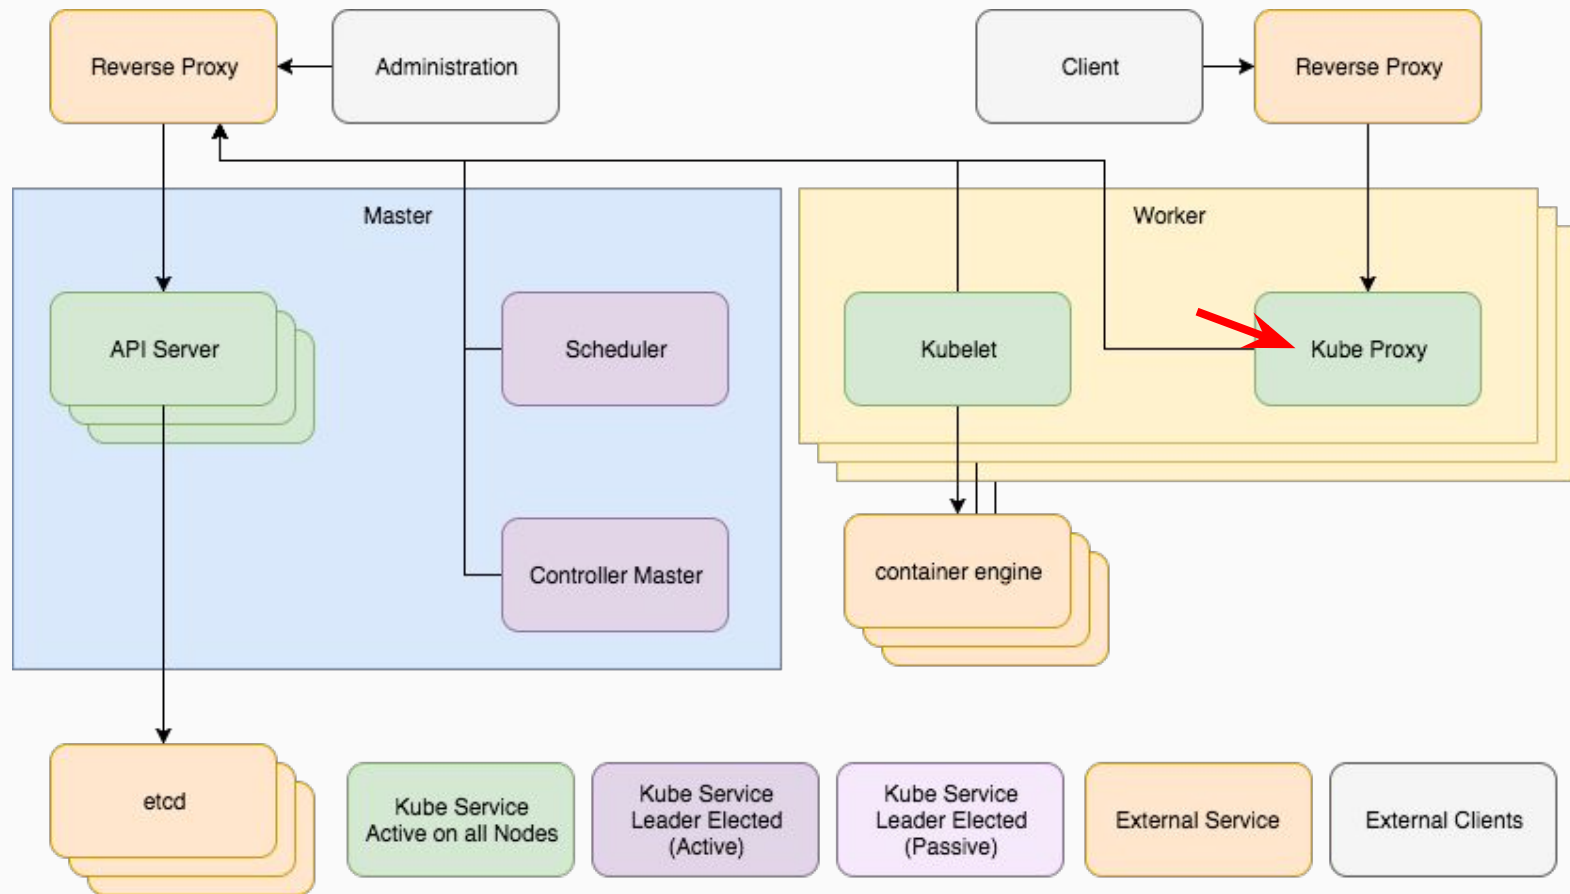

# Kubelet

## Container Management

- Runs containers
  - Interacts with container runtime
- Communicates worker status to cluster
- One instance per worker node

# Kube Proxy

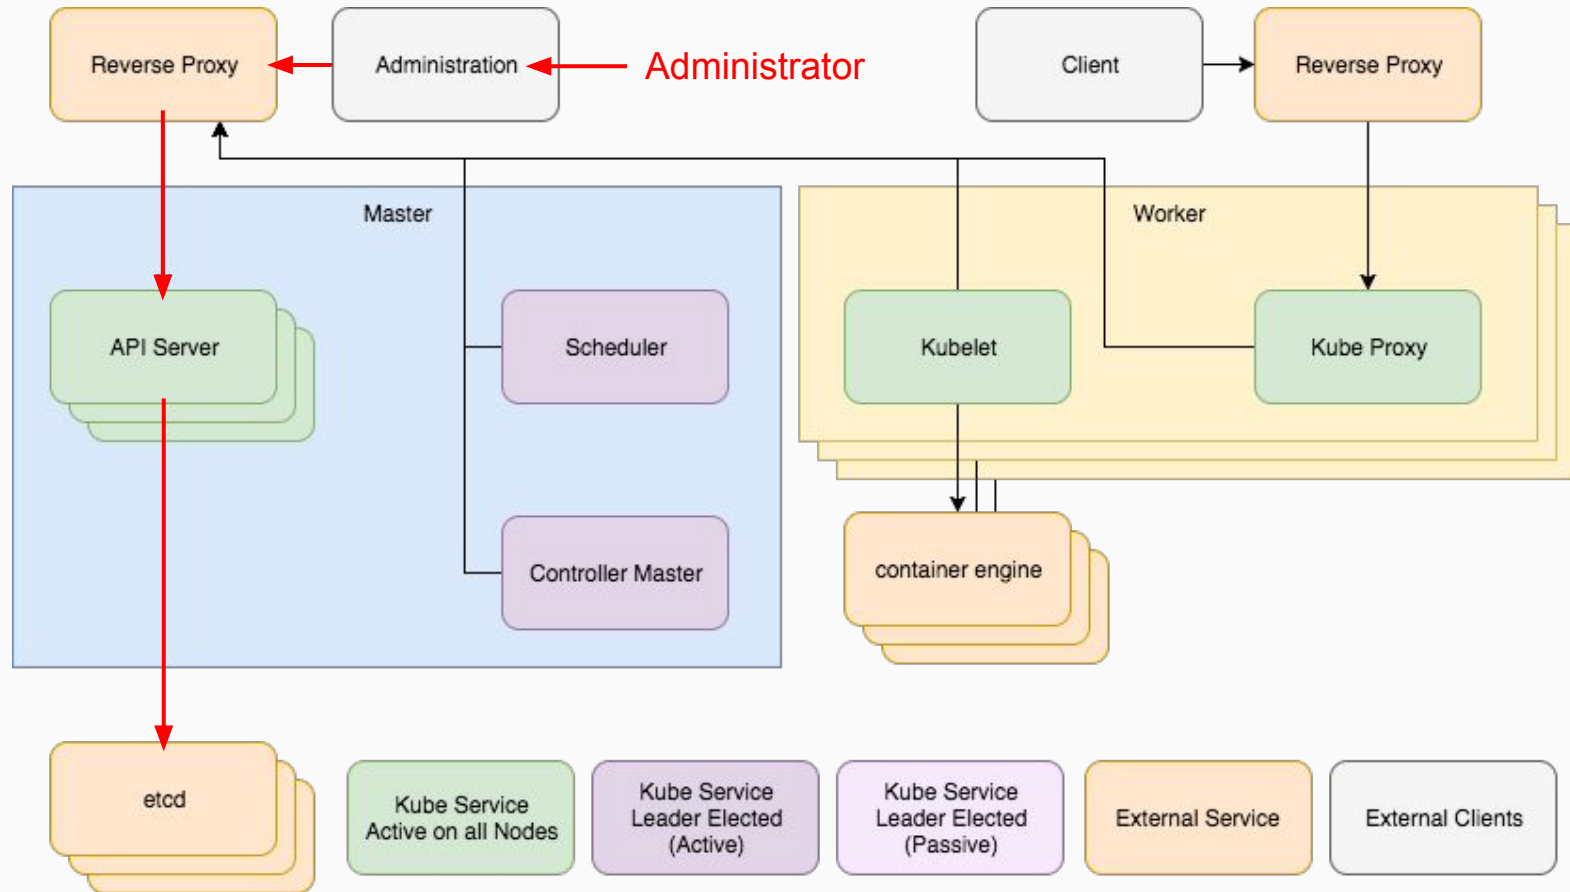

## Network Proxy

- Provides external access to services
  - Supports TCP & UDP
- One instance per worker node

# Application

# Deploying a Service

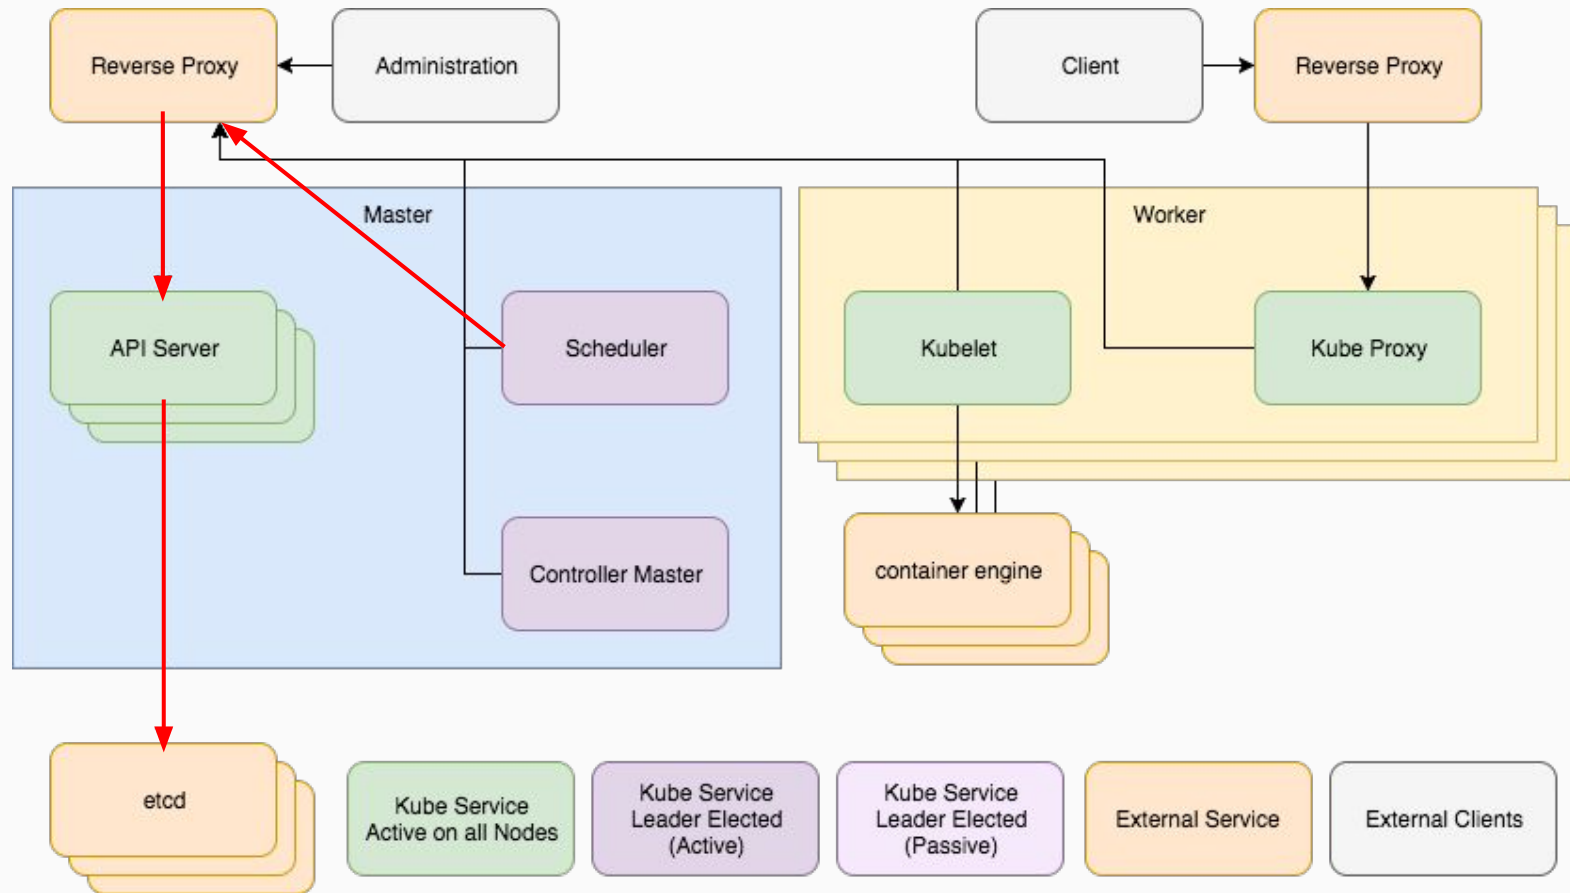

# Deploying a Service

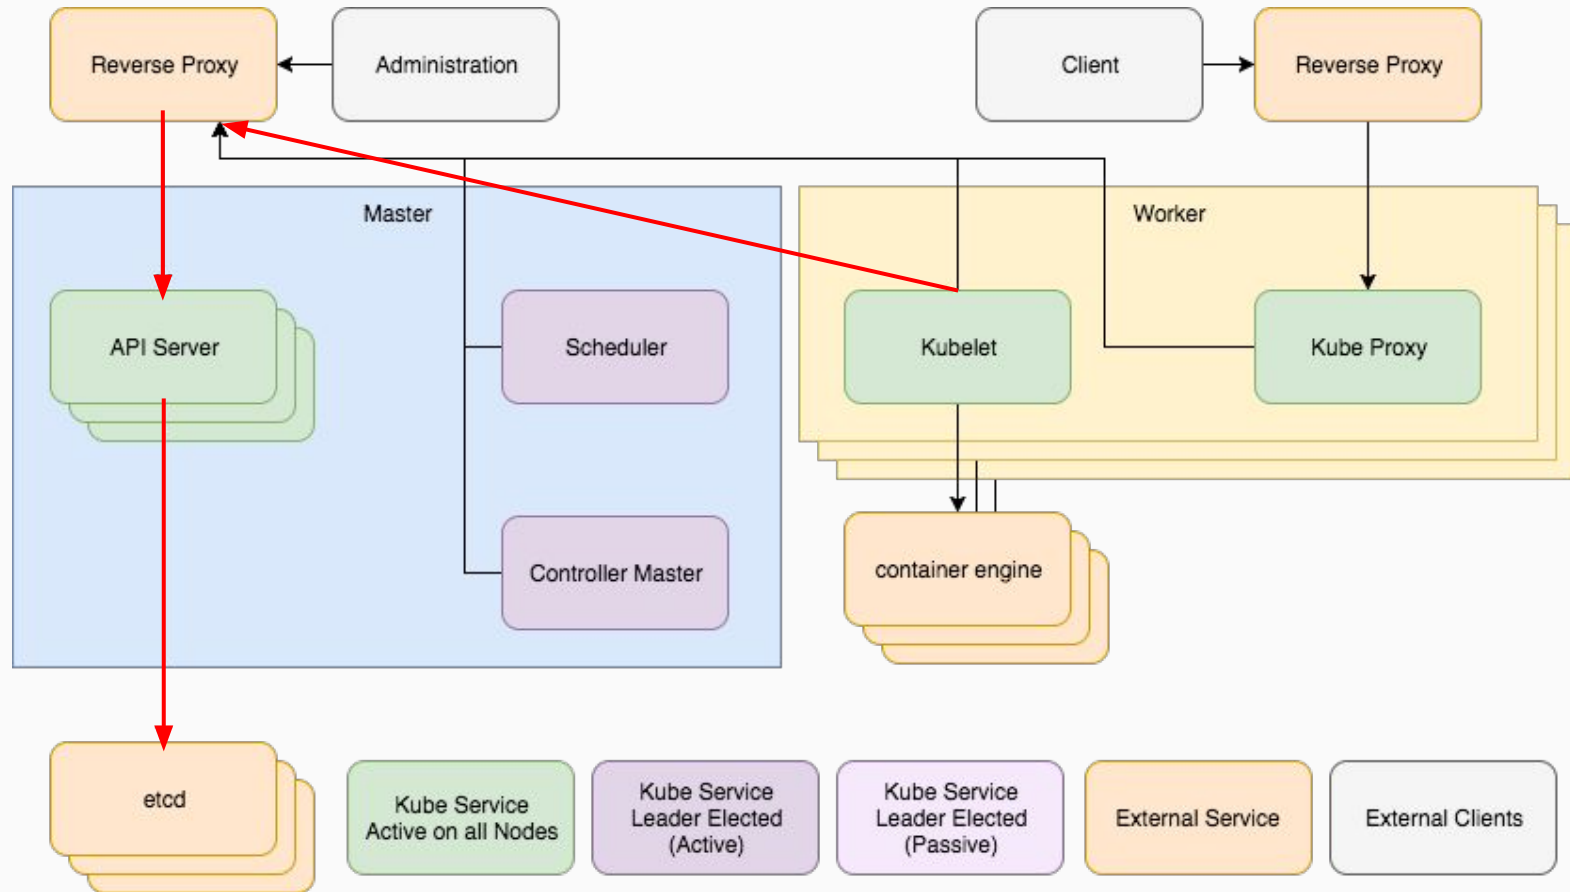

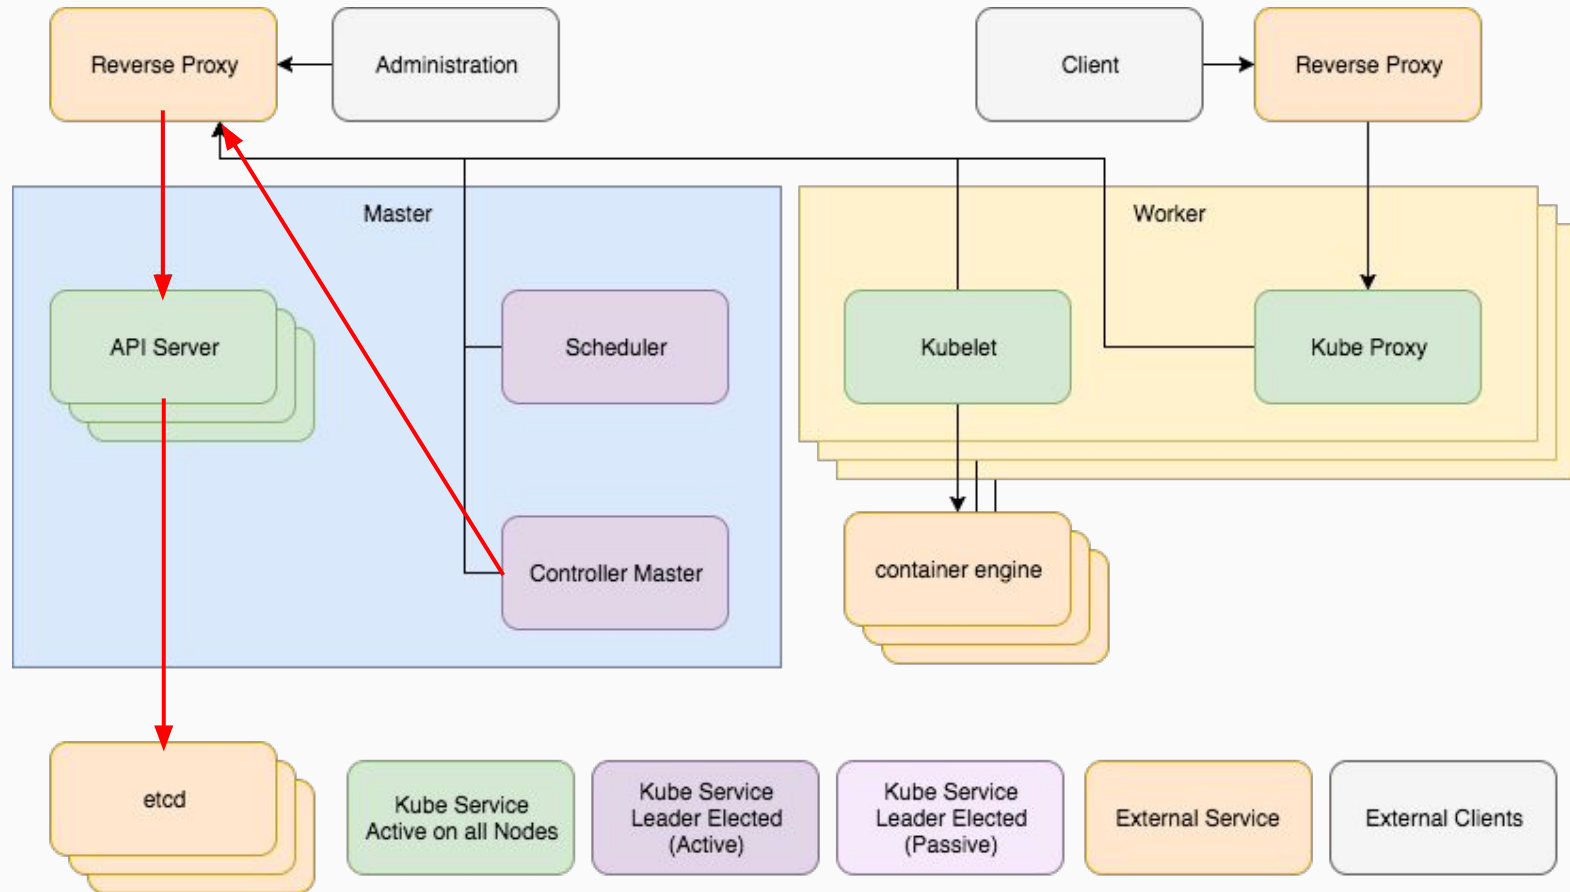

# Deploying a Service
